

Afterward

The calls after a death, made for you.

One conversation with the family. Then a voice agent phones every bank, insurer, utility and pension — waits on hold, says it's an AI, and brings back a verified case reference and a recording for every account.

The government automated its half. The family got the phone calls.

"You'll also need to tell organisations outside government, like employers and private pension providers, banks, and utility companies."

GOV.UK — WHAT TO DO AFTER SOMEONE DIES (VERIFIED SEP 2026)

Tell Us Once

covers government departments. Nothing else.

Death Notification Service

covers member banks and financial firms.
Nothing else.

Everyone else

answers the phone — a dozen calls, queues, the death retold each time, in the worst week of a family's life.

One conversation. Twelve calls. Evidence for each.

Solution — the live board (replaying real captured sessions)

03 / 10

Doctrine, not features

It never guesses

A server-side validator checks every reference against what the clerk actually said. Wrong captures are refused mid-call and re-asked. Anything the family didn't provide becomes an amber "Needs you" card. There is no code path that invents a value.

It says it's an AI

Every call opens with a disclosure that an AI assistant is calling with the family's permission — required by EU AI Act Art. 50 (in force 2 Aug 2026), and by decency first.

Evidence for everything

Every call ends with a stereo recording (institution left, agent right), a timeline, and a verified reference in a shareable Estate Ledger.

Deep in the Voice Agent API

- One live Voice Agent session per call — STT, turn detection, TTS, tools in one WebSocket
- Client-side tools: `press_key` (DTMF), `flag_needs_family`, `record_outcome` — with a validator that can refuse
- `transcription_mode` → `max_accuracy` switched mid-call, right before the reference is spoken
- Per-call keyterms for the deceased's name — never the expected reference (no ground-truth biasing)
- Sponsor-side stereo recordings (left = institution, right = agent) are the Ledger's evidence
- Turn-taking survives scripted IVR menus, hold music and a 6-bit degraded-audio failure hunt

Market

650k

UK DEATHS / YEAR

~3M

US DEATHS / YEAR

Dozens

OF ORGANISATIONS TO NOTIFY PER
ESTATE

Every death creates days of notification work. Funeral directors already sell aftercare and compete on service; estate solicitors bill for this by the hour. The category is proven — Empathy has raised over \$90M, Settld partners with UK banks — and both stop at forms and email. Free services (Tell Us Once, DNS) cover slices and still leave the family holding the phone for the rest: what Afterward sells is the family's time back, plus evidence — and the primary buyer is the funeral director, not the family.

Nobody makes the calls

	Coverage	Mechanism	Evidence trail
Tell Us Once (gov)	Government only	One form	—
Death Notification Service	Member banks only	Web form → banks call the family back	—
Empathy / Settld	Broad	Forms, email, human ops	Status updates
Afterward	Everyone with a phone line	Makes the call — holds, menus, clerks	Verified reference + recording per account

Afterward files Tell Us Once and DNS where they exist — and phones everyone they don't cover.

Business model & roadmap

REVENUE

- **B2B (primary):** funeral directors' aftercare packages — per-case licence, existing budget line, built-in distribution at the moment of need
- **B2B:** estate & probate firms — per-matter, the Ledger drops straight into the file
- **B2C:** per-estate, one price, unlimited institutions

UNIT ECONOMICS (COGS MEASURED, PRICES ARE TARGETS)

Measured: 12 calls = 27m45s agent time → ~2.3 min/call. Dozens of institutions ≈ ~70 min ≈ **£2–3 COGS per estate** → £79–149 per-case licence → at 650k UK deaths × 5% attach: **£2.5–5M ARR**.

NEXT 90 DAYS

- Real outbound leg (Twilio SIP ↔ Voice Agent API) — starting with requirements-discovery calls to real bereavement lines: "what do you need from a family?" — legitimate, harms no one, maps the terrain
- Institution requirements directory built from those calls
- Tell Us Once + DNS filing; document upload & tracking

Honest limits: green means what a first human call achieves – case opened, documents requested. Never "done". The demo institutions are simulated and say so on screen; calling a real bank with a fictional death would be fraud, so we refuse to demo it.
